

I rate my perusal of masters as my proudest achievement. Unlike my experience back home, UCC had exposed me to a wide variety of prospects academically as well as in terms of extracurricular activities. I was among the few students from my batch to pursue, difficult modules like Deep Learning and IoT due to pure love to explore and master those topics. Later during my thesis, I went on to take a challenging full-fledged project combining hardware and software. In my thesis, I developed an Indoor navigation system in a 50*60 square meter testbed combining Machine Learning and IoT sensors, designing testbed architecture, planning sensor placements, collecting test data, learning new technologies and languages, and developing a navigation application. Outside my curriculum, I have tried to explore almost everything UCC had to offer, from fencing, table tennis mountaineering, kickboxing, squash at Mardyke to participating in Kayaking and football outdoor, and many more. I also worked part-time as a Java lab assistant for UCC. From selecting the toughest modules to exploring numerous sports, from taking up challenging projects to finding work life balance admits pandemic for me will be a personal milestone.
